

Linux Commands	Sample Usage
pwd	pwd (Output: /home/username)
ls	ls -la (Lists all files)
cd	cd /var/log (change directory)
cp	cp file.txt backup.txt (copy)
mv	mv filename.txt newfilename.txt (move or rename)
rm	rm file.txt (deletes or removes)
mkdir	mkdir newFolder (Creates new directory)
touch	touch index.html (Creates a new empty file)
cat	cat readme.txt (displays the contents of a file)
chmod	chmod +x script.sh (modify)

Git Commands	Sample Usage	Description
git init	git init	to initialize or start a new get repository in your folder
git status	git status	checks the status of the files if changed
git add	git add index.html	prepares files for saving
git commit	git commit -m "Final"	permanently saves selected files with a message
git log	git log	shows history of past commits
git diff	git diff	shows text changes made before saving
git restore	git restore main.html	brings it back a file to its last save
git branch	git branch feature-copy	makes a separate branch to work without breaking the main
git checkout	git checkout feature-copy	switches to a different branch
git merge	git merge feature-copy	merges the changes from one branch to current branch
git tag	git tag v1.0.0	puts a label on a specific commit
git clone	git clone https://github.com/user/repo.git	downloads existing project or repository from the internet to your computer

The three-tree architecture of Git

The Working Directory - The folder on your computer where you do your coding.

The Staging Area - Moving edited files to the staging area to check before saving using git add.

Repository - Permanently saves everything in the staging area into the repository history.
